AUTHOR: Rudnicki, Tadeusz

TITLE: Studies of the biological effect of 30 Mev electrons

PERIODICAL: Acta Physiologica Polonia, v. 13, no. 6, 1962, 705-715

TEXT: A review of published literature showed that there is a lack of unanimity as regards the biological effect of fast electrons, and in particular their effect on cells in the resting phase and on healthy tissue. A comparison was, therefore, made between the effects of x rays and of fast electrons on healthy-tissue cells in the resting phase. The experimental work was carried out at the Biological Institute of the Zurich University under the direction of Professor Dr. H. Fritz-Niggli. Seventy 3-month old male rats (160 - 180 g in weight) were divided into 3 groups as follows: group 1 - controls, group 2 - irradiated with 30 Mev electrons, and group 3 - irradiated with 180 kv x rays. In both cases 450 r were delivered to the hepatic region over an area 4.5 cm in diameter. After about 24 hours following the irradiation, the animals were

Card 1/3

Studies of the biological ...

P/056/62/013/006/001/003

D461/D307

anesthetized and partial resection of the liver was performed. As a result, almost 70% of the organ was removed (left and middle lobes). After 18, 24, 36, 48 and 72 hours following the operation, groups of 5 animals were decapitated at a time and sections of the right lobe of the liver were taken for histological examination. Histological specimens  $6 \mu$  thick were stained with Heidenheim's hematoxylin and the following were determined: (1) mitotic figures as a function of time after the operation, (2) distribution of mitotic phases, and (3) percentage of abnormal ana- and telophases as a function of post-operative time. Statistical analysis of all the data showed that the effect of damage to hepatic cells in the resting stage on subsequently induced mitotic processes was very nearly the same for both electrons and x rays. Damage due to the electrons is less intensive and more easily repaired. Fast electrons have a selective effect in that they prolong the prophase. The biological efficiency of 30 Mev electrons (from the point of view of a normal liver cell in the resting stage) is only slightly lower than in the case of the 180 kv x rays. There are 3 figures and 2 tables.

"The Influence of X-Irradiation on Resting Liver Cells."

Krakow, Polis Biologica, Vol 16, No 3-4, 1962; p 325.

Abstract (English article): mitotic activity of regenerating liver cells in rats irradiated with single dose of 420 r; abnormal mitoses were most frequent and pronounced when the interval between irradiation and mitosis-inducing partial hepatectomy was shortest. Disturbance in cells which were mitotically active during irradiation was only quantitatively different from disturbance in resting cells. Article is condensed version of the paper presented at symposium on human genetics Warsaw January 1962.

TITLE:

Studies on the biological effect of small doses of ionizing radiation. I. Effects of continued irradiation with small doses of Co<sup>60</sup> gamma rays on spermatogenesis in mice

PERIODICAL:

Acta Physiologica Polonica, v. 14, no. 1,  
1963, 69-80

TEXT: Considerable knowledge has accumulated regarding the effect of strong ionizing radiation on the various cells of the reproductive cycle, and some on the effect of a single exposure of varying duration of small doses. No study, however, has been made on the effect on the gonads of prolonged and continuous exposure to small, near-normal doses, and the author is filling this gap in view of the genetic importance of the problem. The study lasted 2-1/2 years and used male mice bred in the laboratory. Cages 25 x 22 cm were arranged in a ring around a

Card 1/4

L 17266-63

P/056/63/014/001/003/004

O

Studies on the biological effect...

source of Co<sup>60</sup> gamma rays, with the main beam of 0.17 rad per day directed at the floor of the cages containing 100-200 mice at a time. Determinations were made at 2-month intervals on 10-12 animals, immediately replaced with new 2-months old mice, and 5 unexposed mice of same age served as control. Average monthly dose was 5 r, with 92 r the dose for the maximum exposure of 18 months. Nuclei were preserved in Bouin's fluid, and 8 Mu sections dyed with hematoxylin. Using a modified Oakberg division of the spermatogenic cycle into 6 phases, a count (average of 50 cross sections per animal) was taken for each phase of the spermatogones A and B (including intermediate), of primary (resting) spermatocytes, and of spermatocytes of Order I. The mitotic indexes were calculated and the results statistically analyzed. By comparison to controls, author found that spermatogones A did not diminish in number until irradiation of 12 mos. Spermatogones B and their mitoses

Card 2/4

L 17266-63

P/056/63/014/001/003/004

O

Studies on the biological effect... first showed a slight decline from 2-6 mos, then levelled off near normal, then again declined after 12 mos, and the same occurred for the primary and maturing spermatocytes. No qualitative changes appeared before 12 mos, when sporadic changes in form were noted both in mitosis of spermatogones and meiosis of the spermatocytes, involving both chromosome bridges and fragmentation in the ana- or telephase. Author discusses the results and concludes that the continued irradiation caused distinct quantitative, and after 12 mos. also qualitative changes in the spermatogenic cycle. Injury was manifest in the smaller number of cells participating in the cycle (5-12 percent below normal), and in abnormal mitotic and meiotic figures. The genetic effects, even though not proven, are definitely implied. Article contains 2 figures, 2 tables, and 21 references, of which 2 are Soviet. The key reference in the English language reads: Oakberg, E.: Am. J. Anat. 1959, 99, 391.

BAUTHOR: Rudnicki, Tadeusz (Rudnitski, T.)

TITLE: Effect of the total dose on some radiobiological reactions at the cellular level

SOURCE: Acta physiologica polonica, v. 16, no. 3, 1965, 427-433

TOPIC TAGS: radiation damage, mitosis, radiobiology, chromosome

ABSTRACT: Adult male Wistar rats were divided into several groups: Group 1A received irradiation of the rear extremities only, while Group 1B received total body irradiation. Groups 2A & 2B, which were irradiated in the same two ways, were used to determine morphological changes in the chromosomes; for this reason, the animals were given colchicine 3 hrs. before they were decapitated and the bone marrow removed (6, 12, 20, 30 and 40 hrs. after irradiation). The radiation dose was 23 r/min. and each animal received a total of 250 r. The results revealed no real differences in the mean percentage of abnormal mitosis between groups 1A and 1B (57.5 and 61.8, respectively, for telophase and 72.4 and 71.6, respectively, for anaphase). The average number of chromatid aberrations 3 hrs. after irradiation was about 0.5/cell for both local and total irradiation, at which time there were no chromosome aberrations. Later on, the number of chromatid

Card 1/2

L 61738-65

ACCESSION NR: AP5018223

aberrations decreased to almost 0, whereas the number of chromosome changes increased and 20 hrs. after irradiation reached 0,25/cell. Comparison of groups 2A & 2B also showed no differences in the beginning, but 20 hrs. after irradiation the changes in group 2B began to regress more slowly than in 2A. The percentage of recombinations was 17-21% and 8-10% in groups 2B and 2A, respectively. Orig. art. has: 2 tables and 1 figure.

TITLE: Local and distant action of ionizing radiation on resting cells in the liver

SOURCE: Acta physiologica polonica, v. 16, no. 1, 1965, 19-25

TOPIC TAGS: ionizing radiation, liver, mitosis

ABSTRACT: This study was carried out with three groups of male mice: 1) non-irradiated, 2) completely irradiated except for the liver, and 3) nonirradiated except for the liver. The experimental results show that a) the liver regeneration in group 1 sets in 18 hrs after the partial hepatectomy, the mitotic index is at a maximum 6 hrs later and decreases afterwards, and about 19 out of thousand cells display mitotic action 72 hrs after the operation, b) the mitotic action of the cells in the liver regeneration in groups 2 and 3 sets in 24 hrs after the operation but the degree of the mitosis is below that of the nonirradiated group 1,

Card 1/2

2

L 31144-66

ACCESSION NR: AP5009579

c) 72 hrs after the operation the mitotic index of groups 1,2, and 3 is of the same value, d) the percent participation of the mitotic phases in the mitosis is disturbed after the irradiation so that in group 3 about half the cells in the anaphase and telophase undergo abnormal mitosis while in group 2 only about 5% undergo abnormal mitosis. It is concluded that mitotic delay after the irradiation of the resting cells may be due to either the local or distant action of the ionizing radiation, that no marked quantitative differences between the local and distant effect of the radiation on the resting cells of the liver are noted, and that abnormal mitosis could result only from the local irradiation of the resting cells. "The author thanks D. Trojczuk, M.S., for her technical and laboratory work."

TITLE: Experience With Erection of Hydroelectric Units at the Kuybyshev Station

PERIODICAL: V sb.: Energ. str-vo. 2. M.-L., 1958, pp 12-21

ABSTRACT: Speedy erection of hydro units was attained by performing erection and construction work simultaneously. During the initial work stage, erection of the lower parts of the turbines and wicket-gate mechanisms was carried out simultaneously with the laying of the underwater structures and turbine shaft. During the next work stage, construction of the floors and walls of the machine room was carried out simultaneously with the preassembling of components on the erection bays: the 427-t turbine rotor, 180-t turbine housing, 730-t generator stator. During the next work stage, after the turbine rotor had been lowered into the crater, the building construction work was continued in the turbine room, and the roughened-surface concrete was laid up in the main

1981. MARAZUA M. and RUDNIK I. Zakt. Ftyzjochir. IDSKL Sanat. im O. Sokołowskiego, Zakopanem; Dziecięcego Ośrodka Sanat. Prew., Rabce. \*Ropień płuc wywołany przez konika polnego. Lung abscess induced by a grasshopper. POL. TYG. LEK. 1956, 11/40 (1718-1719) Illus. 3

A case of lung abscess with typical radiological picture in a 10-year-old girl. The abscess was induced by a grasshopper (*Lorgillus campestris*). Although the clinical process lasted probably about 9 yr., there was found in the abscess cavity after the excision of the lower lobe a grasshopper with well preserved chitinous parts of the body. The child was sent home from the sanatorium in excellent general condition.

227. RUDNIK J., RYBAKOWA M. and SZPUNAR J. Dziecięcego Ośrodka Sanat.-Prewencyjnego, Rabce. Bronchoskopia w przypadkach niedodmy w gruźlicy u dzieci. Bronchoscopy in cases of atelectasis in pulmonary tb in children GRUŽLICA 1955, 23/II (775-787) Graphs 1 Tables 3 Illus. 5

The final outcome in 130 cases of atelectasis in the course of pulmonary tb in children, treated for several months, was as follows: disappearance of atelectasis, 2 cases; marked regression, 29 cases; partial regression, 39 cases; no improvements: papillomatous granulation, 23; bronchial tb, 20; lesions of single bronchial fistulas, 27; diffuse lesions of the tracheo-bronchial tree, 17; enlargement of the trina, 22; stenosis and deviation of the trachea and major bronchi, 11; typical fistulae from the lymph nodes, 14. In 27 cases no lesions were found at bronchoscopy. Papilloma-like formations and granulation, developing in the bronchi in children, are, most commonly, the signs of fistulae. Bronchoscopy should be performed in every case of atelectasis, in order to ascertain whether and what lesions exist in the tracheo-bronchial tree, particularly in the bronchus draining the area of atelectasis. In cases of atelectasis, the comparison between radiologic and bronchoscopic examinations showed relatively frequent discrepancies. Therefore, in order to assess more accurately the results of therapy, bronchoscopy as well as other examinations should be repeated at the end of treatment.

TITLE: Structure of the valence band of highly alloyed lead telluride

SOURCE: Fizika tverdogo tela, v. 8, no. 5, 1966, 1336-1340

TOPIC TAGS: valence band, telluride, thermal emf, carrier density

ABSTRACT: An attempt is made to determine quantitatively the parameters of the valence band by studying the electrical properties of highly alloyed lead telluride. The electrical properties of p-type lead telluride, having carrier concentrations of  $2 \cdot 10^{18}$  to  $1.4 \cdot 10^{20} \text{ cm}^{-3}$  (according to the Hall effect), are studied. The energy gap between the two valence zones is calculated, and the effective mass of heavy holes is determined. The temperature dependence of the thermal emf is used to determine the variation in the gap as a function of temperature. As temperature increases, the gap decreases ( $\Delta E = \Delta E_0 - \alpha$ ), where  $\alpha = 2 \cdot 10^{-4} \text{ ev/deg}$ . Results, which are considered as interim, show that the valence zone structures of highly alloyed tellurides of lead, germanium, and apparently tin as well, are similar. Comparison with the results of

Card 1/2

L 46929-66

ACC NR: AP6015447

other authors show a discrepancy for  $\Delta E$  and  $m_T^*$ . The authors thank B. Ya. Moyzhes for participation in the work and Ye. K. Kamornik and A. G. Orlov for conducting the spectrum analysis of the sodium content in the samples. Orig. art. has: 4 figures.

(Planing machines--Standards)

APPROVED FOR RELEASE: 06/20/2000

CIA-RDP86-00513R001445930010-4"

Name: RUDNIK, M. S.

Dissertation: Study of a jointing machine with a mechanical feed

Degree: Cand Tech Sci

*Defended at*  
Affiliation: Min Higher Education USSR, Leningrad Order of Lenin  
Forestry Engineering Acad imeni S. M. Kirov

*Publication*  
Defense Date, Place: 1956, Moscow

Source: Knizhnaya Letopis', No 48, 1956
